A PROJECT REPORT ON

**“FINANCIAL PERCEPTION OF
THE MIDDLE-CLASS
HOUSEHOLD’S YOUTH OF INDIA
TOWARDS THE SHARE MARKET”**

Submitted by - Anurag Kumar Chaudhary

Roll No – 23220STA141

INSTITUTE OF SCIENCE

Banaras Hindu University, Varanasi

Under the guidance of **Prof. Nirpeksh Kumar**, Department of Statistics,
Institute Of Science, Banaras Hindu University, Varanasi

In partial fulfilment of the requirements for the award of the degree
Of
BSC Statistics (Hons)

DECLARATION

I hereby declare that the dissertation, titled “FINANCIAL PERCEPTION OF THE MIDDLE-CLASS HOUSEHOLD’S YOUTH OF INDIA TOWARDS THE SHARE MARKET” is a record of original research work undertaken by me in partial fulfilment of the requirements for the award of the degree of Three-Year U.G in BSC Statistics (hons.). I have completed this study under the supervision of Prof. Nirpeksh Kumar, Department of Statistics, Institute of Science, Banaras Hindu University, Varanasi.

I also declare that this dissertation has not been submitted for the award of any degree, diploma, fellowship or other title. I hereby confirm the originality of the work and that there is no plagiarism in any part of the dissertation.

Preface

*This project, titled "**Financial Perception of the Middle-Class Household's Youth of India towards the Share Market**" is the culmination of my academic journey as a final-year student of Statistics. It represents not just a research undertaking, but a sincere attempt to know the perception of the middle-class households/individuals towards the share market (SIP/stock/etc) which prevents them or motivate them to participate in share market. Middle-Class earns, saves but hesitates to invest. To know the cause behind this, whether it's the fear of loss, knowledge constrain, lack of surplus money, behavioural bias or something else like they invest but not in the share market, etc, this project has been documented to know the reason on the reality basis.*

Through this study, I have aimed to explore and analyse the financial perception of the middle-class households majorly across the various cities of Uttar Pradesh towards the Share Market. The research is grounded in primary data collection, statistical analysis, and field level insights. It attempts to highlight employment status, income patterns, and their perceptions toward the Share Market.

This project idea came by thinking of middle class who spend their entire lives in the earning and saving (whether it's employed, unemployed, small vendors or self-employed) but fears to invest even a small proportion of the saving/earning in the SIP/Stocks else if they invest or want to invest then where they prefer like real states, golds/silver, FD/post office or somewhere else. As a statistics student, I have tried to represent these problems into data by statistical tools.

This project would not have been possible without the support of my faculty, peers, and most importantly, the individuals who graciously shared their time and stories. I hope that this work contributes, in however small a way, to greater awareness and policy consideration for motivating and reducing the fear and spreading the awareness towards the investment in Share Market (SIP/Stocks/ETF/etc).

Acknowledgements

It's my pleasure to acknowledge the help, I received from many in preparing this dissertation. Completion of this dissertation is possible with the support of them.

Firstly, I wish to put my profound sense of gratitude to my research guide

***Prof. Nirpeksh Kumar**, Department of Statistics, Institute of Science, B.H.U. Varanasi, for giving supervision and persistence guidance to me. His motivation and constant interest throughout my work have facilitated me to conduct the present work in an uninterrupted and timely manner.*

I would like to express my thanks to Mr. Ansh Kumar, Mr Anurag Ranjan and Mr. Aditya Raj Anand who have very kindly given me the technical assistance in data analysis and finalisation of my work.

One's gratefulness to my parents which cannot be expressed in words. I am highly indebted to them. I would like to express my heartfelt thank all who have directly and indirectly supported me throughout my work.

1. ABSTRACT

Despite growing access to financial markets, participation of middle-class households in India's share market remains limited. This study examines the financial perception of middle-class households towards investments in SIPs (Systematic Investment Plans)/Stocks, with a focus on understanding the reasons behind their reluctance to invest.

Primary data is collected through structured questionnaires covering factors such as income, risk tolerance, financial awareness, saving factor and investment preferences. Using descriptive statistics and basic analytical tools, the study explores the relationship between these factors and investment decisions.

This study focuses on financial perception of future investors i.e. youth towards the share market.

The findings suggest that fear of financial loss, lack of market knowledge, saving factor and preference for traditional investment options like fixed deposits/post office real states and gold/silver are the key reasons for low participation. The study highlights the need for improved financial literacy and awareness to build confidence and encourage informed investment decisions among middle-class households.

This research provides insight into the behavioural and economic factors influencing investment perception in India.

2. INTRODUCTION

2.1 Background of the Study

The share market has emerged as a significant avenue for wealth creation and financial growth in modern economies. In **India**, with increasing digitalization and easier access to trading platforms, investment opportunities in **SIPs** (Systematic Investment Plans) and stocks have become more accessible to the common people. However, despite these developments, participation from middle-class households remains relatively low.

The Indian middle class plays a crucial role in the country's economic structure, characterized by stable income, moderate savings, and a strong inclination toward financial security.

Traditionally, this segment prefers low-risk investment options such as fixed deposits, gold, and real estate. The shift towards equity-based investments has been slow, primarily due to factors such as lack of financial literacy, fear of market volatility, and uncertainty regarding returns.

Factors such as risk tolerance, awareness, past experiences, and social influences significantly shape their attitudes towards share market participation.

In this context, the present study aims to analyse the perception of middle-class households in India regarding investments in Sips/stocks. By using primary data collected through structured questionnaires, the study seeks to examine the reasons behind their reluctance to invest and the key factors affecting their decision-making process.

The findings of this study are expected to provide valuable insights into improving financial awareness and encouraging informed participation in the share market, thereby contributing to better financial inclusion and long-term economic growth.

Definition of classes of India has been considered as per the World Bank (2025).

Family Monthly Income:

- < 35,000 ~ Poor Class
- 35,000- 1.25 lakh ~ Lower Middle Class
- 1.25Lakh – 4 Lakh ~ Upper Middle Class
- 4 Lakh + ~ Rich Class

2.2 Statement of the Problem

Despite the rapid growth and increasing accessibility of the share market in India, participation from middle-class households remains significantly low. While investment options such as stocks and Systematic Investment Plans (SIPs) offer the potential for higher returns, a large section of the middle class continues to rely on traditional and low-risk avenues like fixed deposits, gold, and savings schemes.

This limited participation is primarily driven by factors such as fear of financial loss, lack of adequate knowledge, market volatility, and enough surplus money. Additionally, misconceptions about the share market, past negative experiences, and lack of trust in financial systems further discourage investment. As a result, many middle-class households miss opportunities for long-term wealth creation.

There exists a gap in understanding the actual perceptions, attitudes, and behavioural factors that influence investment decisions within this segment. Without proper analysis, it becomes difficult to design effective financial awareness programs and policies that can encourage informed participation in equity markets.

Therefore, there is a need to systematically study and statistically analyse the financial perception of middle-class households in India towards the share market. This study aims to identify the key barriers, evaluate influencing factors, and provide insights that can help improve financial literacy, reduce fear, and promote more confident investment behaviour among the middle-class people.

2.3 Objective of the Study

Primary Objective:

“TO STUDY THE FINANCIAL PERCEPTION OF THE MIDDLE-CLASS HOUSEHOLD’S YOUTH OF INDIA TOWARDS THE SHARE MARKET.”

Secondary Objectives:

- **To examine the basic insights and the perception** about the share market among the middle-class households and youth.
- **To study the investment preferences** of the middle-class household people.

- **To examine the investment barriers** among middle-class investors.
- **To examine the investment behaviour** in share market if they are investing.
- **To examine the relationship between income, investing** using appropriate statistical methods such as correlation and regression analysis.
- **To examine the relationship between gender and risk perception.**

2.4 SCOPE OF THE STUDY

The present study is confined to analysing the financial perception of middle-class households in India towards investment in the share market, including stocks and Systematic Investment Plans (SIPs). It focuses on key factors such as income, saving behaviour, financial awareness, risk perception, and investment preferences.

The study is based on primary data collected through structured questionnaires from selected middle-class respondents. Statistical tools such as descriptive analysis and basic inferential techniques are used to examine patterns and relationships in investment behaviour.

The scope is limited to the selected sample and does not include other income groups.

Therefore, the findings are specific to the study group but provide useful insights into the reasons behind the hesitation of middle-class households to invest in the share market.

2.5 Importance/Significance of the Study

In a developing country like India where majority of the middle class invest in dreams but always fears to invest in share market even a certain part of the saving or regular earning even in the SIP which can be started at a very low amount. With the evolvement of the modern investment platforms, share market is easily accessible to nearly every citizen through their smartphones but despite of these facilitations, the involvement of the middle-class households in the share market is comparatively low but it can be expected that the **youth section** which are going to be the **future investors** may involve in the share market. But there are certain fear perception and constrains to them also. The report of this survey may be used by the **financial companies** and the **institutions (gov/pvt)** to frame their laws and to understand the middle-class future investors mindset and their preexisting fear about different factors.

This survey has been conducted:

- To examine the basic insights (knowledge) about the share market.
- To examine the fear factors.
- To examine the investment preferences.

2.6 Limitations of the study

The present study is subject to certain limitations that may affect the generalization of its findings. **Firstly**, the study is based on a limited sample size, which may not accurately represent the entire population of middle-class households in India.

Secondly, the research is confined to a specific geographical area, and therefore, the results may not be applicable to other regions with different socio-economic conditions. The study relies solely on **primary data** collected through questionnaires, which may be influenced by respondents' personal biases, lack of awareness, or unwillingness to provide accurate information. Additionally, **time constraints** have restricted the scope of the study, limiting the depth of analysis and the number of variables considered.

Another limitation is that the study focuses only on middle-class households and does not include other income groups, which could provide a more comprehensive understanding of overall market perception. Despite these limitations, the study provides useful insights into the perception of middle-class households towards the share market.

3. Literature Review

Previous studies show that middle-class households prefer safe investments like FDs and gold over the share market due to low risk tolerance.

Research highlights that fear of loss and lack of financial knowledge are major barriers to stock market participation. These factors which drives the investment behaviours of the individuals still needs to be studied more on youth investors.

Studies in India indicate that income, education, and awareness significantly influence investment behaviour. Overall, the literature shows a gap in awareness and confidence, which this study aims to explore further primarily on youth.

4. RESEARCH METHODOLOGY

This study adopts a descriptive and analytical research design to evaluate the financial perception of the middle-class family of India towards the Share Market.

The research methodology followed is outlined below:

4.1 Research Design

The research design for this study is descriptive and analytical. The descriptive part summarises the financial perception of middle-class households towards the share market based on factors such as income, savings, and risk perception.

The analytical part uses statistical tools like cross-tabulation and correlation and regression to examine relationships between variables affecting investment behaviour. This design helps in understanding both the current perception and the factors influencing investment decisions.

4.2 Data Collection

- **Chosen Data Type:**

The study is based on primary data. Data has been collected directly from middle-class respondents through a structured questionnaire covering factors such as income, saving behaviour, financial awareness, risk perception, and investment preferences towards the share market

The data includes both quantitative variables (such as income and investment amount) and qualitative variables (such as attitudes and preferences). Primary data has been used to ensure accurate, relevant, and first-hand information for analysing the financial perception of middle-class households.

- **Primary Data:**

Data was collected directly from individuals through a structured questionnaire. The questionnaire included the monthly/yearly income, investment behaviour, preferences of investment and basic insights and perception towards the share market

- **Sample Size:**

The study conducted on 152 individuals.

4.3 Period of Study:

The period of the study broadly covers the period of April month, 2026.

The study and analysis have been completed by the first week of May ,2026.

4.4 Sampling Method:

A convenience method sampling technique was used due to ease of access and voluntary participation. The sample consisted of individuals/participants from various part of the Uttar Pradesh majorly and rest from different states.

4.5 Tools and Techniques

- **Descriptive Statistics:** Mean, median, standard deviation, and frequency distributions to summarize data.
- **Cross-tabulation:** To study associations between two different variables.
- **Chi-Square test:** To test the independencies of two variables.
- **Correlation Analysis:** To measure the strength and direction of the relationship between fear factor and loss factor. And correlation Matrix between fear, knowledge and surplus money constraints.
- **Simple Linear Regression:** To model the relationship between knowledge and fear factor.
- **Software and Tools:** Data entry and preliminary analysis were performed using **Microsoft Excel**.

4.6 Ethical Considerations

- Participation was voluntary, and respondents were informed about the purpose of the study.
- Personal information was kept confidential, and data was used strictly for academic purposes.

5. Descriptive Analysis and Interpretations:

Percentage Analysis:

Percentage analysis through pie chart, histogram, and frequency table we will have a complete overview of the opinions in terms of the percentage for the comparative analysis.

This can give the basic distribution of the opinions of people on various questions.

We can give the basic interpretation of the opinions without doing the statistical analysis with statistical formulae.

The basic insights and overview about each question are as follows:

PART 1. - DEMOGRAPHIC PROFILE

1. GENDER DISTRIBUTION

1. Gender
152 responses

Figure: 1. Gender Distribution

Gender	Frequency	Percentage (%)
Male	111	73.0
Female	41	27.0
Total	152	100.0

Table.1 – Gender Distribution

INTERPRETATION:

Table 1 shows that the majority of the respondents are the male (72.7 %) and that of the female are 27.3%. The sample is male-dominated; hence, the findings primarily reflect male perspectives toward the share market due to the lower participation of the female in share market related topic.

2. AGE GROUP DISTRIBUTION

2. Age Group
152 responses

Figure: 2. Age Group Distribution

Age Group	Frequency	Percentage (%)
18-25	127	83.6
26-45	16	10.5
46-60	9	5.9
Total	152	100.0

Table 2 – Age Group Distribution

INTERPRETATION:

Table 2 above shows that the majority of the respondents are from the age group 18 to 25 and in fact this age group is about to be the future investors of the India. So, this survey basically covers the majority of the opinion of the future investors of India about their fear of loss, lack of education about the share market, and the lack of surplus money or anything else.

3. EMPLOYMENT STATUS

3. Employment Status

152 responses

Table .3 –Employment Status

Employment Status	Frequency	Percentage (%)
Student	128	84.2
Salaried (Pvt/Govt)	15	9.9
Self-employed	5	3.3
Unemployed/Homemaker	4	2.6
Total	152	100.0

Table 3 – Employment Status

INTERPRETATION:

The majority of respondents are students, indicating that the sample is dominated by **young individuals who are future investors**. This shows that the perception captured in the study mainly reflects the mindset of **youth from middle-class households**. Their limited income and dependency may influence cautious investment behaviour and hesitation toward the share market.

4. EDUCATIONAL BACKGROUND

4. Educational Background
152 responses

Figure: 4. Educational Background

Educational Level	Frequency	Percentage (%)
Graduate/Undergraduate	120	78.9
School Level (6–12th)	15	9.9
Post-Graduate/Professional	15	9.9
Non-formal/Uneducated	2	1.3
Total	152	100.0

Table 4 – Educational Background

INTERPRETATION:

Most respondents are graduates or undergraduates and some are post graduates and some are having schooling only. Despite having formal education, there is still limited participation in the share market, suggesting that **financial literacy is different from general education**.

This highlights a gap between education and practical investment knowledge.

5. FAMILY MONTHLY INCOME (₹)

Figure: 5. Family Monthly Income (₹)

Income Bracket	Frequency	Percentage (%)
₹0 – 35,000	81	53.3
₹35,000 – 1.25 Lakh	62	40.8
₹1.25 Lakh – 4 Lakh	6	3.9
₹4 Lakh+	3	2.0
Total	152	100

Table 5 – Family Monthly Income

INTERPRETATION:

Based on the class division by world bank, 47% samples are from the poor class and 50% samples are from middle-class and rest from rich class.

A large proportion of respondents belong to lower and middle-income brackets, reflecting **typical middle-class financial conditions**. Limited income reduces risk taking ability and encourages preference for safer investments. This explains why youth from such households show **hesitation toward stock market participation**.

PART 2. - SHARE MARKET AWARENESS

7. AWARENESS ABOUT SHARE MARKET

7. Do you know what the Share Market is ?

152 responses

Figure: 7. Awareness about Share Market

Level of Awareness	Frequency	Percentage (%)
Heard, no details	61	40.1
Good understanding	40	26.3
Know, not enough to invest	35	23.0
No knowledge at all	16	10.5
Total	152	100.0

Table 7 – Share Market Awareness

INTERPRETATION:

The very first line of investment is to know about the share market, what it is. How it works, how can we invest in this. In our sample it can be seen that **majority (40%) of the people just have heard about it somewhere** and 26% people agreed that they have a good understanding about it though 23% agreed to the fact that they know the basics but not enough so that they can invest freely and a small proportion is there which never ever heard about it. This shows that awareness about this is increasing among the youth which may let the involvement increase in future.

8. AWARENESS ABOUT MUTUAL FUNDS / SIP

8. Do you know about mutual funds/SIP ?

152 responses

Figure: 8. Awareness about Mutual Funds / SIP

Awareness of MF/SIP	Frequency	Percentage (%)
Yes	104	68.4
No	48	31.6
Total	152	100.0

Table 8 – Mutual Funds/SIP Awareness

INTERPRETATION:

Mutual funds is well known field of investment for the majority of the population having regular or irregular income due to its capacity of being increasing consistently and less fear of loss. **Majority of the population in this survey about 68% is aware of the mutual funds** which shows that there is basic awareness among the youth investors about the mutual funds and yes there are **32%** population which are still unaware of this term “**mutual funds**”.

PART 3. - RISK PERCEPTION

9. IS SHARE MARKET GAMBLING?

9. What do you think , the Share Market is gambling ?

152 responses

Figure: 9. Is Share Market Gambling?

Response	Frequency	Percentage (%)
Depends on knowledge	78	51.3
No	44	28.9
Yes – It is gambling	30	19.7
Total	152	100.0

Table 9 – Gambling Perception

INTERPRETATION:

A very popular and preexisting notion about the share market is that it is gambling like thing in which people gets rich overnight and at the next time they get poor. But in this survey majority of the population believes if you have a better knowledge its not gambling which shows that youth are being aware of this myth. 29% of the population believes that its not gambling at all though 20% still believes its gambling.

10. RISK PERCEPTION OF SHARE MARKET

10. Do you think share market is a risky thing?

152 responses

Figure: 10. Risk Perception of Share Market

Response	Frequency	Percentage (%)
Yes – Risky	71	46.7
Depends on knowledge	67	44.1
No – Not Risky	14	9.2
Total	152	100.0

Table 10 – Risk Perception

INTERPRETATION:

One of the major reasons of the deprivation of the middle-class people of India from the share market is risk taking capacity which comes from the better capital and financial knowledge. In this survey still 47% agreed to the fact that the market is risky and nearly same proportion about 44% agreed that if you have better financial knowledge about the share market it may be less risky and 9% are those who believes it's not risky.

11. IS SHARE MARKET IS THE THINGS OF RICH TYPE PEOPLE?

11. Do you think share market is the things of rich type people ?

152 responses

figure: 11. is share market only for the rich?

Response	Frequency	Percentage (%)
No	98	64.5
Yes	54	35.5
Total	152	100.0

Table 11 – Rich People Perception

INTERPRETATION:

Due to the lack of reach, resources and connectivity it was being considered as the share market are the things of rich type and certainly there was the role of cinema also into this. But due to the technological expansion in this modern era, this perception is changing which can be seen in this survey as **64.5%** of the population denied that share market is only for the reach people but for us also. Though **35.5%** which is good percentage still believes that share market is only for reach people. This data shows that a shift may be seen in future toward the share market by the middle-class future investors.

12. CAN MIDDLE-CLASS EARN PROFIT FROM SHARE MARKET?

12. Do you think a "middle-class" person can actually earn profit through the share market?

152 responses

Figure: 12. Can Middle-Class Earn Profit from Share Market?

Response	Frequency	Percentage (%)
Yes, definitely	104	68.4
Only if very lucky	37	24.3
No, only for rich	11	7.2
Total	152	100.0

Table 12 – Profit Potential for Middle-Class

INTERPRETATION:

Majority of the population (68.4%) are accepting that middle class family and individuals can earn profit through the share market (SIP/stocks) and 24.3% are believing that the middle class can profit only if they are lucky and 7.2% are those who believe that middle class can't earn profit through share market at all.

PART.4 - INVESTMENT BEHAVIOUR AND PREFERENCES

13.MONTHLY INVESTMENT IN SHARE MARKET

13. How much amount do your family invest in share market monthly (SIP/Mutual Funds/Stocks) ?

152 responses

Figure: Q13. Monthly Investment in Share Market

Investment Amount	Frequency	Percentage (%)
I don't invest	101	66.4
₹1 – 1,000	16	10.5
₹1,000 – 10,000	22	14.5
₹10,000 – 25,000	7	4.6
₹25,000 – 50,000	5	3.3
₹50,000+	1	0.7
Total	152	100.0

Table 5.13 – Monthly Investment in Share Market

INTERPRETATION:

From the above questions it can be observed that they believe that share market is not only for and they too can earn profit but still majority of them (66.4%) does not involve in any type of investment in share market due to their investment barriers. And 33.6 % of the population are involved in monthly investment.

14. YEARLY INVESTMENT IN SHARE MARKET (if not monthly)

14. How much amount do your family invest yearly (if don't invest monthly) ?

152 responses

Figure: 14. Yearly Investment in Share Market

Investment Amount	Frequency	Percentage (%)
I don't invest	102	67.1
₹1 – 1,000	9	5.9
₹1,000 – 10,000	14	9.2
₹10,000 – 50,000	12	7.9
₹50,000 – 1 Lakh	6	3.9
₹ 1 Lakh - ₹ 5 Lakh	9	5.9
5 Lakh +	0	0
Total	152	100.0

Figure: 14. Yearly Investment in Share Market

INTERPRETATION:

it can't be expected that each of the middle class invest monthly or on regular basis, and it can be seen that same proportion of the population who does not invest at all is same here but its little different in case of yearly investment. About 6% invest in between 1 to 5 lakh and 4% in between 50,000 to 1 lakh and 17% below 50,000 yearly.

PART 5- INVESTMENT BARRIERS – LIKERT SCALE ANALYSIS

These are three major investment barriers of the middle-class families.

15. How much "**Fear Of Losing Money**" prevent you to investing ? (LOWER to HIGHER Effect) *

1	2	3	4	5
☆	☆	☆	☆	☆

16. How much "**Lack of knowledge**" prevent you to investing ? (LOWER to HIGHER Effect) *

1	2	3	4	5
☆	☆	☆	☆	☆

17. How much "**No surplus money to save**" prevent you to investing ? (LOWER to HIGHER Effect) *

1	2	3	4	5
☆	☆	☆	☆	☆

Barrier	Mean	Median	Std Dev	Min	Max
Fear of Losing Money (Q15)	3.32	3.00	1.28	1	5
Lack of Knowledge (Q16)	3.29	3.00	1.31	1	5
No Surplus Money (Q17)	3.10	3.00	1.20	1	5

15. FEAR OF LOSING MONEY (Barrier Score)

15. How much "Fear Of Losing Money" prevent you to investing ? (LOWER to HIGHER Effect)

152 responses

Figure: 15. Fear of Losing Money (Barrier Score)

Score	Frequency	Percentage (%)
1 (Lowest)	20	13.2
2	15	9.9
3	46	30.3
4	39	25.7
5 (Highest)	32	21.1
Total	152	100.0

Table 15 – Fear of Losing Money (Q15)

INTERPRETATION:

Fear of losing money scored a **mean of 3.32** and **median of 3** on the 5-point scale (**SD = 1.28**), indicating a moderate-to-high deterrent effect. The highest single frequency was at score 3 (46 respondents), followed by score 4 (39 respondents) and score 5 (32 respondents). **The combined score of 4 and 5 (high to very high effect) accounts for 46.7% of respondents, confirming that fear of financial loss is a primary psychological barrier.**

16. LACK OF KNOWLEDGE (Barrier Score)

16. How much "Lack of knowledge" prevent you to investing ? (LOWER to HIGHER Effect)

152 responses

Figure: 16. Lack of Knowledge (Barrier Score)

Score	Frequency	Percentage (%)
1 (Lowest)	20	13.2
2	21	13.8
3	39	25.7
4	39	25.7
5 (Highest)	33	21.7
Total	152	100.0

Table 16 – Lack of Knowledge (Q16)

INTERPRETATION:

Lack of knowledge has a **mean barrier score of 3.29** and **median of 3** ($SD = 1.31$). Scores of 3 and 4 each received 39 responses, and score 5 received 33 responses. This is the second highest barrier, closely following fear of loss. **The combined effect of score 4 and 5 accounts for 47.4% of respondents, suggesting that inadequate financial literacy is nearly as significant a barrier as fear.**

17. NO SURPLUS MONEY (Barrier Score)

17. How much "No surplus money to save" prevent you to investing ? (LOWER to HIGHER Effect)

152 responses

Figure: 17. No Surplus Money (Barrier Score)

Score	Frequency	Percentage (%)
1 (Lowest)	18	11.8
2	26	17.1
3	53	34.9
4	33	21.7
5 (Highest)	22	14.5
Total	152	100.0

Table 17 – No Surplus Money (Q17)

INTERPRETATION:

The financial constraint of insufficient surplus money scored a **mean of 3.10 (SD = 1.20)**. Score 3 was the modal response (53 respondents, 34.9%), with score 4 receiving 33 and score 5 receiving 22 responses. Though **slightly lower in effect than the fear of loss and knowledge barriers**, this remains a considerable obstacle for the lower income segment of the middle class.

Part 6 - Investment Preferences

18. PREFERRED SAFE INVESTMENT OPTION

18. Where do you feel your saving money can give best return safely ?

152 responses

Figure: Q18. Preferred Safe Investment Option

Investment Preference	Frequency	Percentage (%)
Real Estate	57	37.5
Bank FD / Post Office	41	27.0
Gold	29	19.1
Mutual Funds/Share Market	25	16.4
Total	152	100.0

Table 18 – Preferred Safe Investment

INTERPRETATION:

In the preference of investment, it can be seen that investment in **real state is the leading choice** now a days. The **second preference** is led by the **bank FD and post office** which is generally considered to be the safest and easiest way and gold and mutual funds are at the third and fourth preferences respectively.

-

19. SOURCE OF FINANCIAL KNOWLEDGE

19. What is the source of your financial knowledge ?

152 responses

Figure:19. Source of Financial Knowledge

Source	Frequency	Percentage (%)
Social media	57	37.5
No Fixed Source	52	34.2
News / Newspaper	24	15.8
Friends/Relatives	19	12.5
Total	152	100.0

Table 19 – Source of Financial Knowledge

INTERPRETATION:

It is very important that from where you are taking your financial knowledge to be updated financially. As the survey is dominated by the youth whose means of news consumption is social media, and it can be seen that **38% of them use social media** to take financial knowledge and 34% says that no any fixed resources and they may have newspaper/tv/social media/friends etc. in combine for their financial knowledge.28% takes the financial knowledge from friends and newspaper/news.

20. WILLINGNESS TO INVEST IN SIP/MF

20. Will you agree to keep a part of saving money in mutual funds / SIP rather than banks if it gives the return of 7% to 15 % in general on total invested amount ?

152 responses

Figure: 20. Willingness to Invest in SIP/MF

Response	Frequency	Percentage (%)
Not sure, can consider	81	53.3
Yes	59	38.8
No	10	6.6
Never	2	1.3
Total	152	100.0

Table 5.20 – Investment Willingness

INTERPRETATION:

To check their investment will in share market in future this question about the mutual funds was given and result shows that (38.8% who are saying yes and 53.3% who may think to invest in future) nearly 92% of the total population may be the future investors. Though 8% of the total population are not ready to invest at all but majority of the population may show the shift in future.

21. WHERE WOULD YOU PUT ₹50,000?

21. If you were given Rs 50,000 today as a gift, where would you put it?

152 responses

Figure: 21. Where Would You Put ₹50,000?

Choice	Frequency	Percentage (%)
Invest in Stocks/MF	47	30.9
Bank Account	47	30.9
Spend on needs/wants	29	19.1
Buy Gold	28	18.4
Decide later	1	0.7
Total	152	100.0

Table 21 – Gift Money Preference (₹50,000)

INTERPRETATION:

This hypothetical scenario question produced a near-tie between investing in Stocks/Mutual Funds (47 respondents, 30.9%) and keeping it in a Bank Account (47 respondents, 30.9%). Spending on needs/wants was chosen by 29 (19.1%) and buying Gold by 28 (18.4%). Only 1 respondent (0.7%) said they would decide later. This shows that the population have equal interests in investment and saving in the bank of the surplus or saving money.

6. STATISTICAL ANALYSIS

This section presents the results of the inferential statistical analyses performed on the survey data. All tests were conducted at a 5% level of significance ($\alpha = 0.05$). The null hypothesis (H_0) is rejected when the p-value < 0.05 . The following tests have been carried out as per the study's analytical plan.

6.1 Concept of Chi-Square

➤ What Is a Chi-Square (χ^2) Statistic?

A chi-square (χ^2) statistic is a **statistical test** used to compare **observed data** with **expected data** to determine whether there is a significant difference between them. It helps in understanding whether deviations occur due to **chance** or due to an actual relationship.

Chi-square tests are commonly used for **categorical data** (such as gender, preference, yes/no responses). The larger the difference between observed and expected values, the larger the χ^2 value.

Definition

The chi-square test evaluates how much the **observed frequencies** differ from the **expected frequencies** under a given hypothesis.

Key Takeaways

- Chi-square is useful for analysing categorical (nominal) data.
- It measures the difference between observed (O) and expected (E) values
- It depends on:
 - Difference between O and E
 - Sample size
 - Degrees of freedom
- It is used for:
 - Testing **independence of variables**
 - Testing **goodness of fit**

Formula for Chi-Square Statistic

$$\chi^2 = \sum \frac{(O_i - E_i)^2}{E_i}$$

Where:

- **O** = Observed frequency
- **E** = Expected frequency
- **i** = Category index

Types of Chi-Square Tests

1. Chi-Square Test of Independence

- The chi-square test of independence is used to determine whether **two categorical variables are statistically independent or associated**.
- It tests the null hypothesis that **no relationship exists** between the variables.

Example:

A study is conducted to examine whether **gender and course choice** are related.

Observed frequencies are collected and compared with expected frequencies.

If a significant difference is found, the null hypothesis of independence is rejected, indicating an **association between variables**.

- If no relationship → variables are **independent**
- If relationship exists → variables are **dependent**

Conditions for Application

- Data must be obtained from a **random sample**
- Variables should be **categorical**
- Observations must be **independent**
- Expected frequencies should be **sufficiently large** (generally ≥ 5)

Uses of Chi-Square Test of Independence

- To examine **association between two categorical variables**
- To analyse **contingency tables**
- To test whether variables are **independent or dependent**

2. Chi-Square Test of Goodness of Fit

- The chi-square goodness of fit test is used to examine whether the **observed frequency distribution** of a sample differs significantly from a **theoretical (expected) distribution**.
- It tests the null hypothesis that the sample data follows the specified distribution.

Example:

A marketing analyst assumes that **women above 45 years** are the primary consumers of a product. After collecting data from 500 individuals, the observed distribution is compared with the expected distribution. A significant difference leads to rejection of the assumption.

Conditions for Application

- Data should be obtained from a **random sample**
- Variables must be **categorical in nature**
- Observations should be **independent**
- Expected frequencies should be **adequately large** (generally ≥ 5)

Uses of Chi-Square Test

- To test the **goodness of fit** of a distribution
- To compare **observed and expected frequencies**
- To determine whether deviations are due to **sampling fluctuation or real difference**

➤ Concept of pooling in Chi-Square Test

When at least 20% of the cells of expected frequencies are < 5 then we need pooling i.e. we have to combine two rows or column of the observed frequencies as required.

Row Pooling: We combine two rows for pooling

Column Pooling: We combine two rows for pooling

6.2 Chi-Square test of Independence

Analysis – 1: Chi-Square Test of Independence for Share Market Awareness (Q7) vs Willingness to Invest (Q20)

Chi-Square Test:

This test examines the relationship between a respondent's level of share market awareness (Q7) and their willingness to invest in mutual funds/SIPs at a guaranteed return of 7%–12% (Q20).

Hypotheses:

H₀: There is no significant association between Share Market Awareness (Q7) and Willingness to Invest (Q20).

H₁: There is a significant association between Share Market Awareness (Q7) and Willingness to Invest (Q20).

Observed Frequency

Awareness\Willingness	Yes	Not sure right now but I can think	No	Never	row total
I have heard of it, but don't know the details.	21	39	1	0	61
I know but not enough to invest.	14	20	1	0	35
No	2	7	5	1	15
Yes, I have a good understanding.	22	15	3	1	41
column total	59	81	10	2	152

Observed Frequency (Pooled):

Awareness \ Willingness	Yes	Not sure	No/Never (R3+R4)	Row Total
Low Awareness (R1+R2)	35	59	2	96
High/ No Awareness (R3+R4)	24	22	10	56
Column Total	59	81	12	152

Expected Frequency

Awareness \ Willingness	Yes	Not sure	No/Never	Row Total
Low awareness	37.263	51.158	7.579	96
High/No awareness	21.737	29.842	4.421	56
Column Total	59	81	12	152

$$\chi^2 (\text{cal}) = 14.78$$

$$\chi^2 (\text{tab}) = 5.99$$

Since $\chi^2 (\text{cal}) > \chi^2 (\text{tab})$, so reject H_0 at 5% level of significance.

Interpretation:

This result indicates that there is a **statistically significant association** between:

- **Share market awareness level**
- **Willingness to invest in SIP/Mutual Funds**

In other words, **the two variables are not independent.**

On examination of the observed frequencies shows the clear patterns:

- Respondents with “**good understanding**” show the **highest willingness to invest**, with a large proportion selecting “Yes” (22 out of 40).
- Respondents with “**no knowledge**” are mostly concentrated in the “**Not Sure**” **category** (11 out of 16), indicating hesitation and lack of confidence.
- Intermediate awareness groups (“heard, no details” and “know, not enough”) show **mixed responses**, but still lean toward uncertainty rather than strong investment intent.

Analysis – 2: Chi-Square Test of Independence for Gender (Q1) vs Risk Perception (Q10)

This test examines the relationship between the income and the investment in the share market.

Hypotheses:

- **H₀:** There is no significant association between Income and Investment.
- **H₁:** There is a significant association between Income and the Investment.

Observed Frequency

Risk perception \Gender	Female	Male	row total
Yes	22	49	71
No	2	12	14
Depends upon your knowledge	17	50	67
column total	41	111	152

Expected Frequency

Risk perception\Gender	Female	Male	row total
Yes	19.15132	51.84868	71
No	3.776316	10.22368	14
Depends upon your knowledge	18.07237	48.92763	67
column total	41	111	152

$$\chi^2 (\text{cal}) = 1.8115$$

$$\chi^2 (\text{tab}) = 5.9914$$

Since $\chi^2 (\text{cal}) < \chi^2 (\text{tab})$,

So, we failed to reject H₀ at 5% level of significance

Interpretation:

This result indicates that there is **no statistically significant association** between:

- **Gender**
- **Risk perception of the share market**
- Both **male and female respondents** show similar patterns in risk perception.
- A large proportion in both groups consider the market **risky or dependent on knowledge**.

Gender does not significantly influence how individuals perceive risk in the share market.

Thus, risk perception is **not dependent on gender**.

Analysis – 3: Chi-Square Test of Independence for Income (Q5) vs Investment (Q13)

This test examines the relationship between the Income level and the Investment in the share

Hypotheses:

H₀: There is no significant association between Income and Monthly Investment.

H₁: There is a significant association between Income and Monthly Investment.

Observed Frequency

Income \ Investment	1 - 1000	1000 - 10,000	10,000 - 25,000	25,000 - 50,000	50,000 +	I don't invest	row total
0 – 35,000	9	12	2	0	1	57	81
35,000 – 1.25 Lakh	5	9	2	3	0	43	62
1.25 Lakh – 4 Lakh	1	1	2	1	0	1	6
4 Lakh+	1	0	1	1	0	0	3
Column total	16	22	7	5	1	101	152

Observed Frequency (Pooled)

Income \ Investment	Small invest (1–10,000)	Large invest (10,000+)	I don't invest	Row Total
Low (0–35,000)	21	3	57	81
Middle (35K–1.25L)	14	5	43	62
Higher (1.25L+)	2	5	1	8
Column Total	38	13	101	151

Expected Frequency (Pooled)

Income \ Investment	Small invest (1–10,000)	Large invest (10,000+)	I don't invest	Row Total
Low (0–35,000)	20.25	6.927631579	53.82236842	81
Middle (35K–1.25L)	15.5	5.302631579	41.19736842	62
Higher (1.25L+)	2.25	0.769736842	5.980263158	9
Column Total	38	13	101	152

$$\chi^2 (\text{cal}) = 30.33$$

$$\chi^2 (\text{tab}) = 9.48$$

Since $\chi^2 (\text{cal}) > \chi^2 (\text{tab})$, so reject H_0 at 5% level of significance.

Interpretation:

This result indicates that there is a **statistically significant association** between:

- **Family income level**
- **Monthly investment in the share market**
- Individuals in **higher income groups** show **greater participation in investment categories**
- Lower income groups are heavily concentrated in “**No Investment**”
- The **seasonal income group** shows almost **no investment activity**, indicating financial instability
- As income increases, the tendency to invest also **increases significantly**

6.3 - Analysis 4: Correlation Matrix and Multiple Correlation

(Q. No. 15,16,17) (Fear of Loss, Lack of Knowledge & Surplus Money)

R1.23: How fear depends upon knowledge and money

R2.13: How knowledge depends upon fear and money

R3.12: How money depends upon fear and knowledge

1 – fear of losing money

2 – lack of knowledge

3 – lack of surplus money

r_{12} = correlation (1,2) = **0.522203882**

r_{13} = correlation (1,3) = **0.424064348**

r_{32} = correlation (3,2) = **0.503873618**

Correlation Matrix:

1	0.52	0.42
0.52	1	0.5
0.42	0.5	1

$$R = \sqrt{\frac{r_{12}^2 + r_{13}^2 - 2r_{12}r_{13}r_{23}}{1 - r_{23}^2}}$$

R1.23 = 0.55, R2.13 = 0.61, R3.12 = 0.54

Interpretation:

Fear of loss is moderately influenced by lack of knowledge and financial constraints.

Lack of knowledge has the strongest combined relationship, indicating it is a key factor affecting other barriers.

Financial constraint is moderately affected by fear and lack of knowledge.

6.4 - Analysis 5: Simple Linear Regression Analysis

Regression: Fear of Loss (Q15) on Lack of Knowledge (Q16)

This analysis examines whether lack of financial knowledge influences fear of investment loss.

$$Y = \beta_0 + \beta_1 X + \varepsilon$$

Where:

- Y = Fear of Loss (Q15)
- X = Lack of Knowledge (Q16)
- β_1 = Regression Coefficient
- β_0 = Intercept

Estimated Regression Equation:

$$Y(\text{est}) = 1.64 + 0.51X$$

- Regression Coefficient (β_1) = **0.51**
- Intercept (β_0) = **1.64**
- $R^2 = 0.273$
- p-value < **0.001**

Interpretation:

- The positive coefficient (**0.51**) indicates that **fear of loss increases with lack of knowledge**.
- Specifically, a **1-unit increase in knowledge barrier leads to a 0.51 increase in fear score**.
- The R^2 value (0.273) shows that **27.3% of variation in fear is explained by lack of knowledge**.
- The p-value (< 0.001) confirms that the relationship is **statistically significant**.
- There exists a **significant positive relationship** between lack of knowledge and fear of investment.
- The regression results confirm that lack of financial knowledge significantly increases fear of investment loss.

7. Summary of the key findings:

Test / Analysis	Result	Interpretation
χ^2 ind test – Awareness vs Willingness to invest	χ^2 (cal) $>$ χ^2 (tab), reject H_0	Significant Association
χ^2 ind test – Gender vs Risk Perception	χ^2 (cal) $<$ χ^2 (tab), failed to reject H_0	No Significant Association
χ^2 ind test – Income vs Investment	χ^2 (cal) $>$ χ^2 (tab), reject H_0	Significant Association
Correlation Analysis of Fear, Knowledge & Money	$R_{1.23} = 0.55$, $R_{2.13} = 0.61$, $R_{3.12} = 0.54$	Lack of knowledge has the strongest combined relationship
Regression Analysis of Fear of loss on Knowledge Factor	$Y(\text{est}) = 1.64 + 0.51X$	As Lack of knowledge increases the Fear of Loss Increases

8. Conclusions

1. Awareness and Perception

- A significant portion of respondents have basic awareness of the share market, but lack proper understanding required for investment.
- Awareness is found to have a strong positive relationship with willingness to invest, confirming that knowledge plays a crucial role.

2. Risk Perception

- Majority of respondents consider share market risky or depends on knowledge.
- Gender does not significantly influence risk perception, indicating that risk attitude is common across groups.

3. Investment Behaviour

- Despite awareness, 66% respondents do not invest in the share market.
- Traditional investment options such as real estate, FD, gold are still preferred.
- However, a large proportion shows future willingness to invest, indicating potential growth.

4. Income and Investment Relationship

- A significant association exists between income and investment.
- Higher income groups are more likely to invest, while lower income groups are concentrated in non-investment category.

5. Investment Barriers (Core Finding)

- The three major barriers identified are:
 - Fear of loss (highest impact)
 - Lack of knowledge (almost equal impact)
 - Lack of surplus money
- These barriers are interrelated, not independent.

6. Correlation & Multiple Correlation Insight

- All three barriers show moderate positive relationships.
- Lack of knowledge has the strongest influence, making it the central factor.

7. Regression Result (Key Statistical Evidence)

- A significant positive relationship exists between:
 - Lack of knowledge → Fear of loss
- As knowledge decreases, fear increases significantly.

Overall Conclusion:

One of the major reasons of reluctance of the middle-class households of India from the share market is lack of knowledge about the share market which creates the fear of losing money and yes lack of surplus money to somewhat extent.

Though a shift can be observed in youth and future investors towards the share market but still a significant proportion still relies on traditional investment options (which are considered to be safer) like Gold/Silver, Real Estates, Bank FD/Post Office etc.

9. Suggestions

1. Improve Awareness

- Financial education should be introduced at school and college level.
- Basic knowledge about share market, SIP, and stocks should be taught.
- Awareness programs and seminars should be conducted.

2. Reduce Fear

- Students should be encouraged to start with small investments.
- Demo trading and practical exposure may be provided.
- Real examples should be used to explain risk and return.

3. Promote SIP

- SIP should be promoted as a safe and simple investment option.
- People should be informed that investment can start with small amounts.
- Long-term benefits should be explained clearly.

4. Improve Access

- Easy and user-friendly investment platforms should be promoted.
- Awareness about online trading apps should be increased.
- Digital access should be improved in all areas.

5. Manage Income

- Youth and regular earners should be encouraged to save regularly.
- Small savings should be converted into investments.
- Budgeting habits should be developed.

6. Diversify Investment

- People should not depend only on FD, gold, or real estate.
- Awareness about different investment options should be given.
- Balanced investment approach should be promoted.

7. Government Role

- Government should run financial awareness campaigns.
- Policies should be simple and transparent.
- Investor protection should be ensured.

8. Use Social Media

- Social media should be used to spread correct financial knowledge.
- Verified content should be promoted.
- Youth should be guided to avoid misleading information.

9. Focus on Youth

- Special programs should be designed for young investors.
- Early investment habits should be encouraged.
- Students should be guided towards financial planning.

11. Appendix:

TOPIC: SHARE MARKET AND THE MIDDLE CLASS OF INDIA.

1. GENDER *

- ☐ MALE
- ☐ FEMALE
- ☐ OTHER

2. AGE GROUP (YEARS)*

- ☐ 18–25
- ☐ 46–60
- ☐ 60+

3. EMPLOYMENT STATUS *

- ☐ STUDENT
- ☐ SALARIED (PRIVATE/GOVT)
- ☐ SELF-EMPLOYED/BUSINESS OWNER
- ☐ UNEMPLOYED / HOMEMAKER

4. EDUCATIONAL BACKGROUND *

- ☐ SCHOOL LEVEL (10TH-12TH)
- ☐ GRADUATE/UNDERGRADUATE
- ☐ POST-GRADUATE/PROFESSIONAL (CA, PHD, MBA)
- ☐ NON-FORMAL EDUCATION/UNEDUCATED

5. FAMILY MONTHLY INCOME (₹) *

- ☐ 0 – 35,000
- ☐ 35,000 – 1.25 LAKH
- ☐ 1.25 LAKH – 4 LAKH
- ☐ 4 LAKH+
- ☐ SEASONAL / YEARLY (IRREGULAR INCOME)

6. FAMILY YEARLY INCOME (IF INCOME IS NOT MONTHLY)?

- ☐ 0 – 4.25LAKH
- ☐ 4.25 LAKH – 16.60 LAKH
- ☐ 16.60 LAKH – 51.50 LAKH
- ☐ 51.50 LAKH+

7. DO YOU KNOW WHAT THE SHARE MARKET IS? *

- ☐ YES, I HAVE A GOOD UNDERSTANDING.
- ☐ I HAVE HEARD OF IT, BUT DON'T KNOW THE DETAILS.
- ☐ I KNOW BUT NOT ENOUGH TO INVEST.
- ☐ NO, I DON'T KNOW ANYTHING ABOUT IT

8. DO YOU KNOW ABOUT MUTUAL FUNDS/SIP?

☐ YES ☒ NO

9. WHAT DO YOU THINK, THE SHARE MARKET IS GAMBLING?

☐ YES
☐ NO
☐ DEPENDS UP ON YOUR KNOWLEDGE

10. DO YOU THINK SHARE MARKET IS A RISKY THING?

☐ YES
☐ NO
☐ DEPENDS UP ON YOUR KNOWLEDGE

11. DO YOU THINK SHARE MARKET IS THE THINGS OF RICH TYPE PEOPLE?

☐ YES
☐ NO

12. DO YOU THINK A "MIDDLE-CLASS" PERSON CAN ACTUALLY EARN PROFIT THROUGH THE SHARE MARKET?

☐ YES, DEFINITELY.
☐ ONLY IF THEY ARE VERY LUCKY.
☐ NO, IT'S ONLY FOR THE RICH.

13. HOW MUCH AMOUNT DO YOU INVEST IN SHARE MARKET MONTHLY (SIP/MUTUAL FUNDS/STOCKS)?

☐ 1 – 1,000
☐ 1,000–10,000
☐ 10,000 – 25,000
☐ 25,000 – 50,000
☐ 50,000+
☐ I DON'T INVEST

14. HOW MUCH AMOUNT DO YOU INVEST YEARLY (IF DON'T INVEST MONTHLY)? *

☐ 1 – 1,000
☐ 1,000 – 10,000
☐ 10,000–50,000
☐ 50,000–1 LAKH
☐ 1 LAKH– 5 LAKH
☐ 5 LAKH +
☐ I DON'T INVEST

15. "FEAR OF LOSING MONEY" PREVENTS YOU TO INVESTING HOW MUCH? (LOWER TO HIGHER)

☐ 1
☐ 2
☐ 3
☐ 4
☐ 5

16. "LACK OF KNOWLEDGE" PREVENTS YOU TO INVESTING HOW MUCH? (LOWER TO HIGHER)

- ☐ 1
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5

17. "NO SURPLUS MONEY TO SAVE" PREVENTS YOU TO INVESTING HOW MUCH? (LOWER TO HIGHER)

- ☐ 1
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5

18. WHERE DO YOU FEEL YOUR SAVING MONEY CAN GIVE BEST RETURN SAFELY?

- ☐ BANK FD / POST OFFICE
- ☐ GOLD
- ☐ REAL ESTATE (LAND / PROPERTY)
- ☐ MUTUAL FUNDS/SHARE MARKET

19. WHAT IS THE SOURCE OF YOUR FINANCIAL KNOWLEDGE?

- ☐ NEWS/ NEWSPAPER
- ☐ SOCIAL MEDIA
- ☐ FRIENDS/RELATIVES
- ☐ NO ANY FIXED SOURCE

20. WILL YOU AGREE TO KEEP A PART OF SAVING MONEY IN MUTUAL FUNDS / SIP RATHER THAN BANKS IF IT GIVES THE RETURN OF 7% TO 15 % IN GENERAL ON TOTAL INVESTED AMOUNT?

- ☐ YES
- ☐ NOT SURE RIGHT NOW BUT I CAN THINK
- ☐ NO
- ☐ NEVER

21. IF YOU WERE GIVEN ₹ 50,000 TODAY AS A GIFT, WHERE WOULD YOU PUT IT?

- ☐ SPEND IT ON NEEDS/WANTS
- ☐ INVEST IN STOCKS/MUTUAL FUNDS
- ☐ BANK ACCOUNT FOR FUTURE USE
- ☐ BUY GOLD

THANKS FOR YOUR PRECIOUS TIME, PATIENCE AND PARTICIPATION!

ANURAG KUMAR CHAUDHARY
